Aloina brevirostris (*Hook. & Grev.*) Kindb., new for Greece, the Iberian Peninsula and the Canary Islands

Aloina brevirostris (*Hook. & Grev.*) Kindb. is a widely distributed species in Europe, ranging from north and central Europe to northern Italy (Delgadillo, 1975; Düll, 1984).

Hitherto, only four *Aloina* species were known in the Iberian Peninsula, *A. alooides* (Schultz) Kindb., *A. ambigua* (B. & S.) Limpr., *A. bifrons* (De Not.) Delg. and *A. rigida* (Hedw.) Limpr. (Casas, 1991), and only four in the Canary Islands, *A. alooides*, *A. ambigua*, *A. rigida* (Düll, 1984) and *A. humilis* M.T. Gallego, Cano & Ros (Gallego *et al.*, in press). According to Düll (1995a, b, c, d, e), Damm & Düll (1995), Preuss & Düll (1995), and Sauer (1995), three taxa occur in Greece: *A. alooides*, *A. ambigua* and *A. rigida*.

During a revision of *Aloina* specimens from the material preserved in European herbaria of this genus, we were able to identify material belonging to *A. brevirostris* from Spain and Greece. The new collections exhibit all the typical features of *A. brevirostris* such as basal marginal cells forming a membranous border in the leaf, a poorly developed costa which is reduced to 1–2 stereid layers, suborbicular leaves with cucullate apex, synoicous condition in the Spanish material and the presence of a peristome basal membrane. However a longer operculum was observed in the Spanish and Greek material than in the Central European collections. The new records are as follows: **Greece:** Cyclades Archipelago, Santorini islands, Thira, 25° 27' E 36° 22' N, altitude 500 m, Mt. Profitis Ilias, *H. Sipman & T. Raus*, 16 May

1990 (B 271370); **Iberian Peninsula:** Navarra, Arguedas, cerca de Los Molares, XM2173, altitude 270 m, *P. Heras*, 17 March 1985 (VIT 331/85); **Canary Islands:** Tenerife, Puerto de San Marcos, altitude 30 m, *D. G. Long.*, 1 April 1997 (E 5730). Lanzarote, Hascha Grande, altitude 350 m, *L. Malme*, 1 January 1978 (O 688).

ACKNOWLEDGEMENTS

We are grateful to the curators of B, E and O, and P. Heras (VIT) for the loan of specimens. This research was carried out with financial aid from DGES of Spain (Project PB96-1111-CO2-01).

TAXONOMIC ADDITIONS AND CHANGES: Nil.

On the presence of Orthotrichum pulchellum Sm. in Spain

Orthotrichum pulchellum Sm. has a disjunct distribution comprising oceanic zones of western North America and western Europe. Its known area in Europe extends from the British Isles and N.W. France to Poland and western Scandinavia (Düll, 1985, 1992; Hill, Preston & Smith, 1994; Vitt, 1973). It has also been reported from Sicily and continental Italy (Cortini Pedrotti, 1992). Since Casares Gil (1915) reported *O. pulchellum* from a unique locality of the Spanish Central range, this taxon has been consistently included in the Spanish moss flora (Casas, 1981, 1991). However, it was not found in later studies on epiphytic bryophytes of this range (Lara, 1995), nor in the coastal mountains of the Iberian Peninsula where ecological
